## **ELGAR TWO-YEAR WARRANTY**

---

Elgar Electronics Corporation (hereinafter referred to as Elgar) warrants its products to be free from defects in material and workmanship. This warranty is effective for two years from the date of shipment of the product to the original purchaser. Liability of Elgar under this warranty shall exist provided that:

- the Buyer exposes the product to normal use and service and provides normal maintenance on the product;
- Elgar is promptly notified of defects by the Buyer and that notification occurs within the warranty period;
- the Buyer receives a Return Material Authorization (RMA) number from Elgar's Repair Department prior to the return of the product to Elgar for repair, phone 800-73-ELGAR (800-733-5427), ext. 2295;
- the Buyer returns the defective product in the original, or equivalent, shipping container;
- if, upon examination of such product by Elgar it is disclosed that, in fact, a defect in materials and/or workmanship does exist, that the defect in the product was not caused by improper conditions, misuse, or negligence; and,
- that Elgar QA seal and nameplates have not been altered or removed and the equipment has not been repaired or modified by anyone other than Elgar authorized personnel.

This warranty is exclusive and in lieu of all other warranties, expressed or implied, including, but not limited to, implied warranties of merchantability and fitness of the product to a particular purpose. Elgar, its agents, or representatives shall in no circumstance be liable for any direct, indirect, special, penal, or consequential loss or damage of any nature resulting from the malfunction of the product. Remedies under this warranty are expressly limited to repair or replacement of the product.

## **CONDITIONS OF WARRANTY**

- To return a defective product, contact an Elgar representative or the Elgar factory for an RMA number. Unauthorized returns will not be accepted and will be returned at the shipper's expense.
- For Elgar products found to be defective within thirty days of receipt by the original purchaser, Elgar will absorb all ground freight charges for the repair. Products found defective within the warranty period, but beyond the initial thirty-day period, should be returned prepaid to Elgar for repair. Elgar will repair the unit and return it by ground freight pre-paid.
- Normal warranty service is performed at Elgar during the weekday hours of 7:30 am to 4:30 pm Pacific time. Warranty repair work requested to be accomplished outside of normal working hours will be subject to Elgar non-warranty service rates.
- Warranty field service is available on an emergency basis. Travel expenses (travel time, per diem expense, and related air fare) are the responsibility of the Buyer. A Buyer purchase order is required by Elgar prior to scheduling.
- A returned product found, upon inspection by Elgar, to be in specification is subject to an inspection fee and applicable freight charges.
- Equipment purchased in the United States carries only a United States warranty for which repair must be accomplished at the Elgar factory.

## SAFETY NOTICE

Before applying power to the system, verify that the unit is configured properly for the user's particular application.

### WARNING!

**HAZARDOUS VOLTAGES IN EXCESS OF 260 VRMS, 370V PEAK MAY BE PRESENT WHEN COVERS ARE REMOVED. QUALIFIED PERSONNEL MUST USE EXTREME CAUTION WHEN SERVICING THIS EQUIPMENT. CIRCUIT BOARDS, TEST POINTS, AND OUTPUT VOLTAGES MAY BE FLOATING ABOVE (BELOW) CHASSIS GROUND. INTERNALLY, IN ADDITION TO THE VOLTAGES MENTIONED ABOVE, DC POWER SUPPLY VOLTAGES OF  $\pm 60\text{VDC}$  MAY BE PRESENT. SUCH DC VOLTAGES ARE CAPABLE OF SHORT CIRCUIT CURRENTS OF UP TO SEVERAL HUNDRED AMPERES.**

Installation and service must be performed by qualified personnel who are aware of dealing with attendant hazards.

Ensure that the AC power line ground is connected properly to the AC Power Source. Similarly, other power ground lines including those to application and maintenance equipment must be grounded properly for both personnel and equipment safety.

Always ensure that facility AC input power is de-energized prior to connecting or disconnecting the power cable(s) and/or installing or removing the unit from the AC Power Source. Similarly, the AC Power Source circuit breaker must be switched OFF (0) prior to connecting or disconnecting input and/or output power cable(s) and/or installing or removing the unit from the AC Power Source.

During normal operation, the operator does not have access to hazardous voltages within the chassis. However, depending on the user's application configuration, HIGH VOLTAGES HAZARDOUS TO HUMAN SAFETY may be generated normally on the output terminals. Ensure that the output power lines are labeled properly as to the safety hazards and that any inadvertent contact with hazardous voltages is eliminated. To guard against risk of electrical shock during open cover checks, do not touch any portion of the electrical circuits. Even when the power is off, capacitors can retain an electrical charge. Use safety glasses during open cover checks to avoid personal injury by any sudden failure of a component.

Some circuits are live even with the front panel circuit breaker of the AC Power Source turned OFF (0). Servicing, and even fuse verification as well as connecting wiring to the chassis must be accomplished with the power removed via external means. Some components that can hold a charge for a time after power has been removed, such as storage capacitors, are used in this equipment. These parts have discharging devices connected to provide a means for the discharge of voltages when the power is removed. Wait at least two minutes after removal of power to allow the discharging of these parts.

This equipment is designed to be operated in a manner specified by the manufacturer for both personnel and equipment safety. Operating this equipment in a manner NOT specified by the manufacturer, the protection provided by the equipment may be impaired.

## 1.1 INTRODUCTION

This section describes the Model 1001SLE/1751SLE Series AC Power Sources and associated circuit boards, assemblies and interconnecting signals. This section provides a sound basis for understanding the roles performed by the instrument electronics and should be a precursor to any troubleshooting or maintenance. The user should frequently refer to the schematics located in Section IV of this manual.

Topics of this section are well advanced of normal Operator/ Programmer activities. An understanding of both analog and digital design, associated devices, and terminology is necessary to fully understand the material presented in this section. For details of the inner workings of components, refer to the Individual Device Manufacturer's Data books.

Prior to the detailed level of discussion of the assemblies and boards within the power source, a top level system overview is provided. An understanding of both top level and circuit activities is most valuable should the user find it necessary to investigate a suspected fault or malfunction within the power source.

If the power source has a PIP (Plug-In Programmable oscillator) installed, refer to the Service Manual covering the PIP being used and become familiar with the theory of operation. This understanding of the PIP theory of operation will enhance the user's understanding of the power source.

## 1.2 SYSTEM OVERVIEW

Figure 1-1 identifies the power amplifier functional relationships. The Preamplifier PC Board plugs into the motherboard. The preamplifier/power stage gain is stabilized and is determined by an AC feedback loop. Another feedback loop from transformer T3 controls regulation. To achieve an overall gain sufficient to produce the required power amplifier output voltages, a step-up transformer is employed. This step-up transformer, T2, is interposed between the power amplifier and the output load. Meter M1, a 0 to 300 VAC indicator, monitors the output voltage and is mounted on the front panel of the power source. Resistor R1, the front panel AMPLITUDE control, governs the input signal with a magnitude of approximately 2 VRMS. This signal is derived from either a plug-in oscillator module or from an external signal source.

## 1.3 INTERCONNECTION AND POWER SUPPLIES

(Refer to Schematic No. 6071076 for the 1001SLE, or to Schematic No. 6121045 for the 1751SLE.)

Input power enter at terminal block, TB1, on the rear panel of the power source. The input is passed through a line filter, and is applied to the input power circuit breaker, CB1, which breaks both sides of the input power line. The circuit breaker applies the input power to the primary of the input power transformer, T1, +8V power supply transformer, T5, and the cooling fan(s).

Figure 1-1. Model 1001SLE/1751SLE Simplified Block Diagram

The secondary of the input power transformer, T1, is applied to a full wave bridge rectifier, U1. After rectification, the voltage is filtered by capacitors C1 and C2 to make the +/-50VDC supplies required for the power amplifier. There are supply bleeder resistors attached to the C1 and C2 filter capacitors to discharge the filter capacitors after power is turned off. The secondary of the +8V power supply transformer, T5, is applied to a full wave bridge rectifier, U1. After rectification, the voltage is applied to the power indicator, DS1, and is also connected to the Motherboard to be used in the Plug-In oscillator module to create the +5VDC logic supply. This secondary is fused with a 2A Slo-Blo type fuse, F1, located next to T5 in the chassis.

The motherboard assembly interfaces with the oscillator, whether a plug-in or an external signal source. The preamplifier plugs into the motherboard.

The motherboard connectors are as follows:

- J1 allows the connection of AMPLITUDE control pot, R1 located on the front panel.
- J2 interfaces with the Upper and Lower Heatsink assemblies.
- J3 connects the Motherboard to the J1 connector located on the rear panel via a cable assembly (Part Number 5121051).
- J4 provides connections for the current transformer, T3, which controls regulation via feedback.
- J5 provides optional relay control connections, if configured.
- J6 allows for optional PIP voltage and current sense, if configured.
- J7 provides optional connections for the "T" Test option, which allows current monitoring and current limit programming, if configured.
- J8 provides optional connections for the "D" Disconnect option, and also allows connections for multi-amplifier system. Only found on the 5071077 Motherboard Assemblies, if configured.
- Connections E1, E2, and E3 provide optional Sync connections for PIP options via rear panel mounted BNC connectors, if equipped.

The motherboard includes several relays as follows:

- K1 is the optional 65/130V Range Drive relay, if configured.
- K2 is the oscillator signal disable relay.
- K3 is the optional 130/260V Range Drive relay, if configured.
- K4 is the optional "D" Disconnect Drive relay (found only on the 5071077 Motherboard Assemblies), if configured.
- K5 is the optional "D" Disconnect sense voltage relay (found only on the 5071077 Motherboard Assemblies), if configured.

Refer to Schematic Drawing No. 6071075 and 6071077 for more detail on the motherboard connections and relays.

The amplifier's output goes to transformer T2 where the voltage is stepped up to the required level for output on terminal block TB2. The T2 secondary winding are 4 individual 0-65VAC output windings. These winding are brought to an internal terminal block, TB3. The first two windings are jumpered in series for a 0-130VAC output. The remaining two windings are also series connected for 0-130VAC output. The two 0-130VAC outputs are brought to the rear panel output terminal block, TB2. TB2, via jumpers, determines the output voltage range of either 0-130VAC (parallel connected) or 0-260VAC (series connected) output voltage range. The output voltage is also available at the front panel binding posts E1 (Red), E2 (White), and E3 (Black). The 0 to 300 VAC Meter, M1, allows the output voltage to be monitored on the front panel.

## 1.4 PREAMPLIFIER

(Refer to Schematic No. 6070004.)

The preamplifier stabilizes the gain of the power source via an AC feedback loop. The preamplifier works with T3 to control regulation.

The preamplifier circuit embodies a first stage differential amplifier U1A/B, which receives its signal input from AMPLITUDE control, R1. The differential amplifier receives feedback from the output amplifier, thereby maintaining approximately zero DC offset to the output transformer. The emitter currents are supplied by R5 from the +12V supply, regulated by CR1. The output of U1B provides the base drive for Q1 which operates as a class A amplifier. Q1 supplies the base drive for common emitter driver Q5 and emitter follower Q4. Diodes CR2, CR3, and CR4 provide a small amount of forward bias to the output amplifier to minimize crossover distortion. Q4 and Q5 are drivers for the emitter followers on the power heatsink assemblies. Transistors Q2 and Q3 are part of a circuit designed to protect the power transistors on the power heatsink assemblies. Power transistor protection on the preamplifier is driven by feedback from the heatsink assemblies. Current flow in the upper half of the power heatsink is sampled by a resistor, R6, on the heatsink and applied through R29 of the preamplifier to the base of Q2. Q2 is the upper current limit transistor. When the voltage is sufficient to turn on Q2, Q2 conducts and diverts drive current from the base of Q4, thus preventing any further increase in output current. Simultaneously, the current in the lower half of the power heatsink is sampled by R7 on the motherboard. This voltage is applied through R31 of the preamplifier to the base of Q3. Q3 is the lower current limit transistor. When Q3 conducts it diverts drive current from the base of Q5, thus preventing any further increase in output current. The resistor diode network, in the base circuits of Q2 and Q3, senses the amplifier output voltage and modifies the bias voltages of Q2 and Q3 to further reduce the output current under short circuit or severe overload conditions. This prevents excess dissipation in the power transistors on the heatsink assembly. Negative AC feedback, from the power transistor's output, is fed back to the base of U1A through resistor R11. Capacitor C5, across R11, helps stabilize the amplifier against high frequency instabilities.

In order to maintain proper load regulation, the primary current of output transformer T2 is sensed by current sense transformer T3. As the load is applied to the output of the unit, a positive feedback signal is developed at the secondary of T3 and is applied across shunt resistor R27 and regulation adjustment potentiometer R26 of the preamplifier board. This signal is then applied to the input of the differential amplifier through R3. Capacitor C2 and resistor R2 make up a boost network which increases the positive feedback at higher output frequencies to maintain regulation. The preamplifier board operates from the positive and negative 50 VDC produced by chassis full wave bridge rectifier U1.

## **1.5 HEATSINK ASSEMBLIES**

(Refer to Schematic No. 6920026 for the 1001SLE, or Schematic No. 6121024 for the Model 1751SLE.)

The heatsink assemblies are mounted in the wind tunnel and house the power transistors. The power transistors produce the necessary amplifier output current to feed the primary of chassis output transformer T2. T2 will subsequently step up the voltage to the required level for output (refer to Schematic Nos. 6071076 or 6121045, as required, for T2 circuitry). The resistors, in the emitter circuitry of each power transistor, ensure equal current sharing. The heatsink assembly is operated from positive and negative 50 VDC which is produced by chassis full wave bridge rectifier U1 and filter capacitors C1 and C2 (refer to Schematic Nos. 6071076 or 6121045, as required, for U1 circuitry). Thermal switch TK1, shown on the heatsink schematic, removes the drive signal from the amplifier, via the preamplifier, in the event of overheating. Overheating may occur from excessive load application or restricted airflow through the wind tunnel.

The preamplifier contains circuitry which protects the power transistors. Current flow is sampled in the upper heatsink by R6 and is sampled in the lower heatsink by chassis resistor R7. The voltage developed by these two sampling resistors is fed to the preamplifier current limit transistors Q2 and Q3.

## 2.1 GENERAL

This section contains procedures for corrective maintenance of the Model 1001SLE/1751SLE AC Power Source. Information provided includes checkout, troubleshooting, disassembly for repair, and adjustments. A list of test equipment required for maintenance and adjustments is also included in this section. The Model 1001SLE/1751SLE is delivered with all adjustments and calibrations completed. Further adjustment should not be required unless a malfunction occurs and/or certain critical parts are replaced.

If the procedures of this section and the circuit descriptions contained in Section I do not provide sufficient information to locate and correct a malfunction, the assistance of the Elgar Customer Service Department should be requested. Equipment should not be returned to the Elgar factory without the express authorization of Elgar Corporation or its authorized representative. Elgar cannot assume the responsibility for equipment returned without authorization.

**WARNING!** Hazardous voltages are present when operating this equipment. Please read the Safety Notice at the beginning of this manual prior to installation, operation, or maintenance.

## 2.2 REQUIRED TEST EQUIPMENT

The test equipment required to conduct performance verification procedures and for troubleshooting is listed in Table 2-1. Substitute equipment may be employed provided the equipment meets the accuracy specifications of the equipment.

**Table 2-1. Required Test Equipment**

Name	Manufacturer and Model Number	Characteristics
Multimeter	Simpson Model 260	20,000 ohms/volt AC, DC, and ohms
Differential Voltmeter	Fluke Model 931AB	RMS Volts range to 1000 VAC
AC Ammeter	Fluke	With amp clamp
Power Variac		Capable of at least 30 amps
Oscilloscope	Tektronix Model 455/A2/B2	Dual trace oscilloscope, DC to 60 MHz
Probe	Tektronix Model 6105	X10 probe
Distortion Analyzer	Hewlett-Packard Model 333A	
Resistive Load	States Company (P/N 33525)	

**WARNING!** Remove power when performing maintenance on the unit. Failure to comply can result in serious electrical shock to individuals coming in contact with live voltages at exposed terminals when the unit is energized.

### **2.3 TROUBLESHOOTING ACCESS**

Refer to Figures 2-1 and 2-2 (1001SLE) or Figures 2-3 and 2-4 (1751SLE) for major component locations. The assembly drawings in Section IV should be used to locate parts on board assemblies.

### **2.4 PERIODIC MAINTENANCE**

The only periodic maintenance required by the power source is removing the dust and dirt which has accumulated during operation. Examine the power heatsinks as excessive dirt buildup in this area could cause overheating of the power transistors. A medium pressure air jet can aid in cleaning of the heatsinks. Also ensure that the preamplifier board and oscillator plug-in are clean.

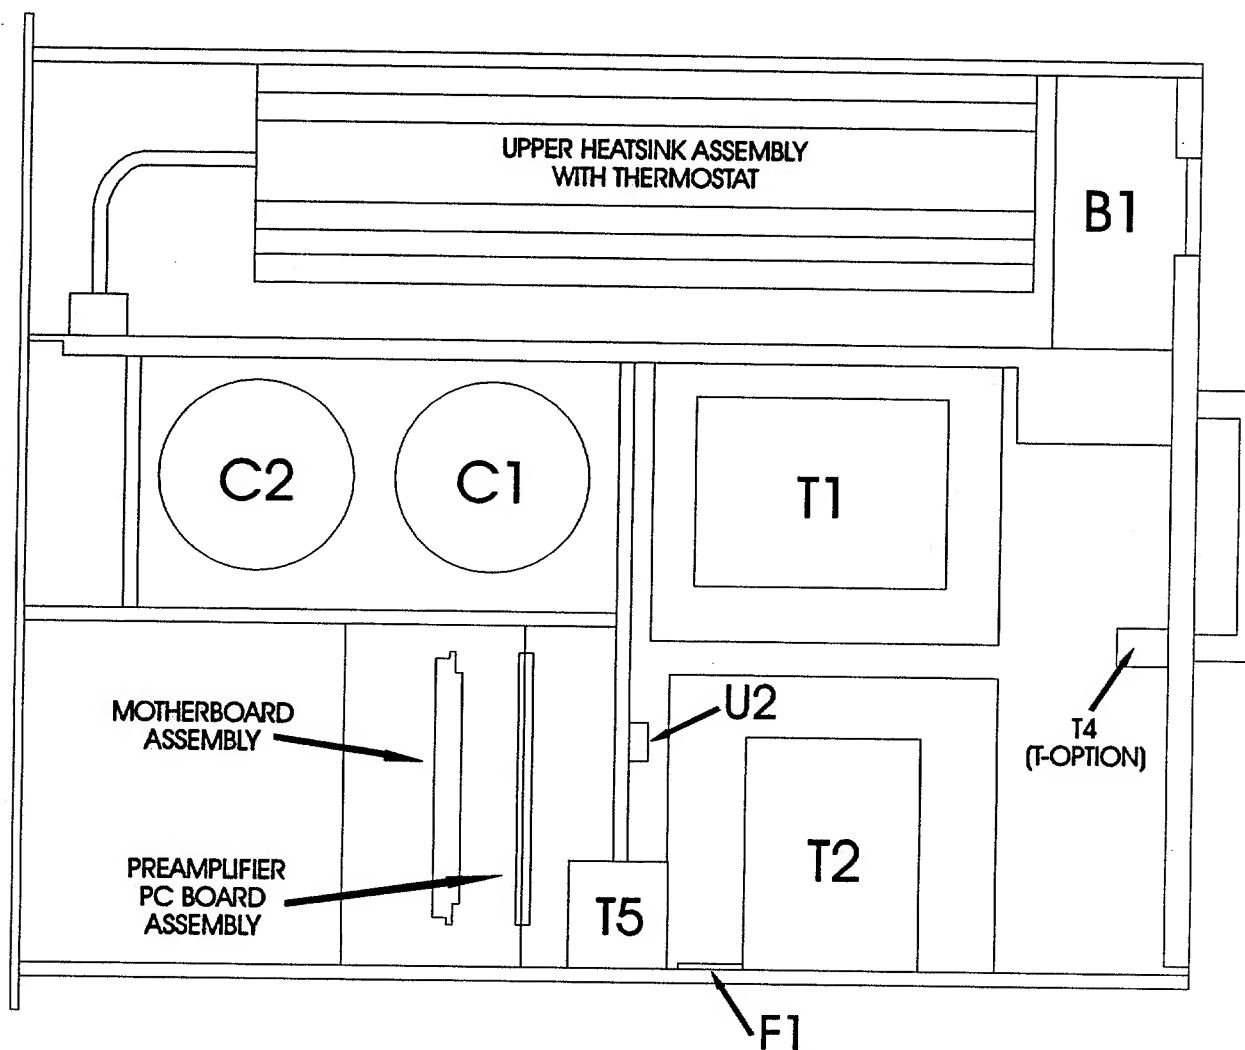

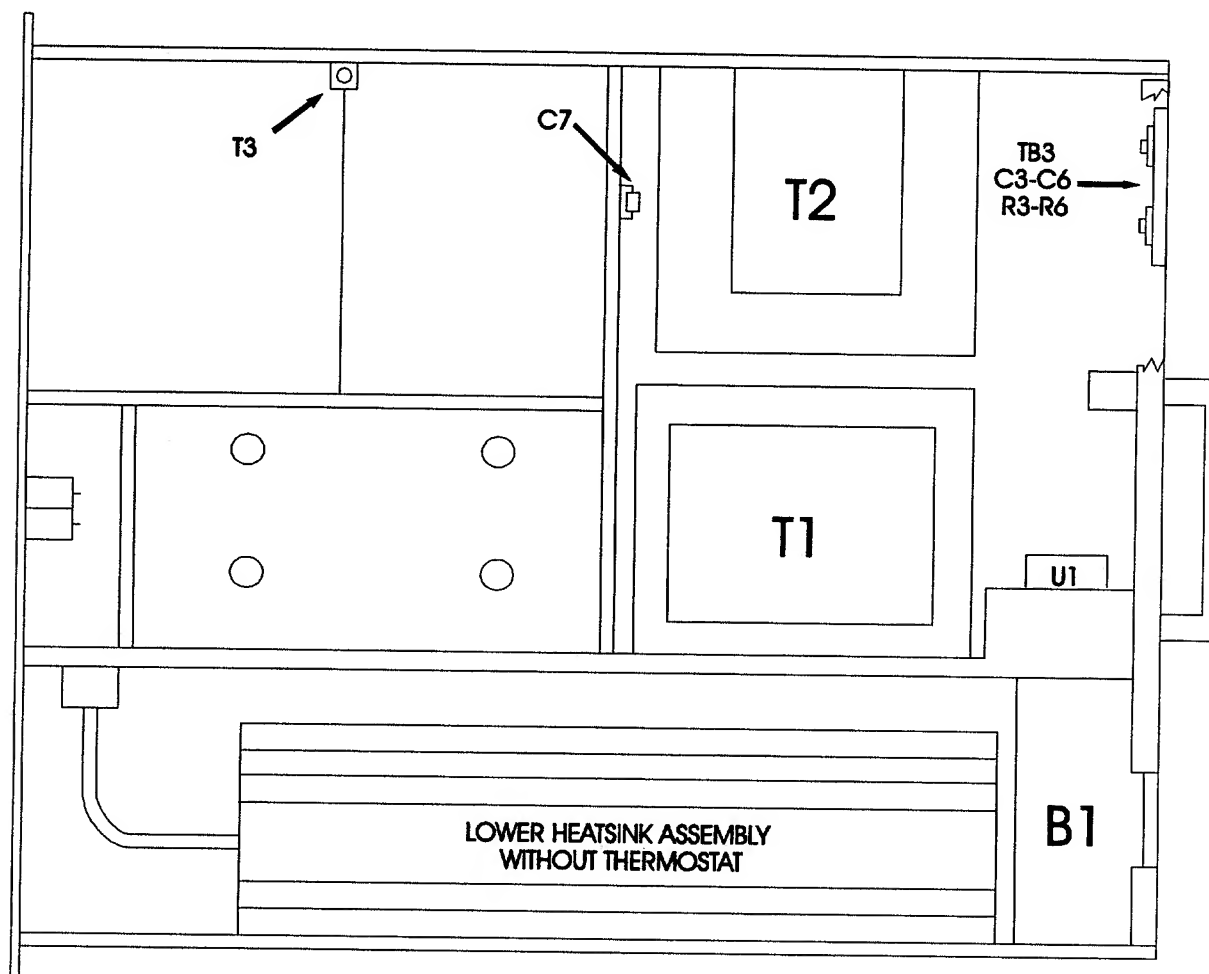

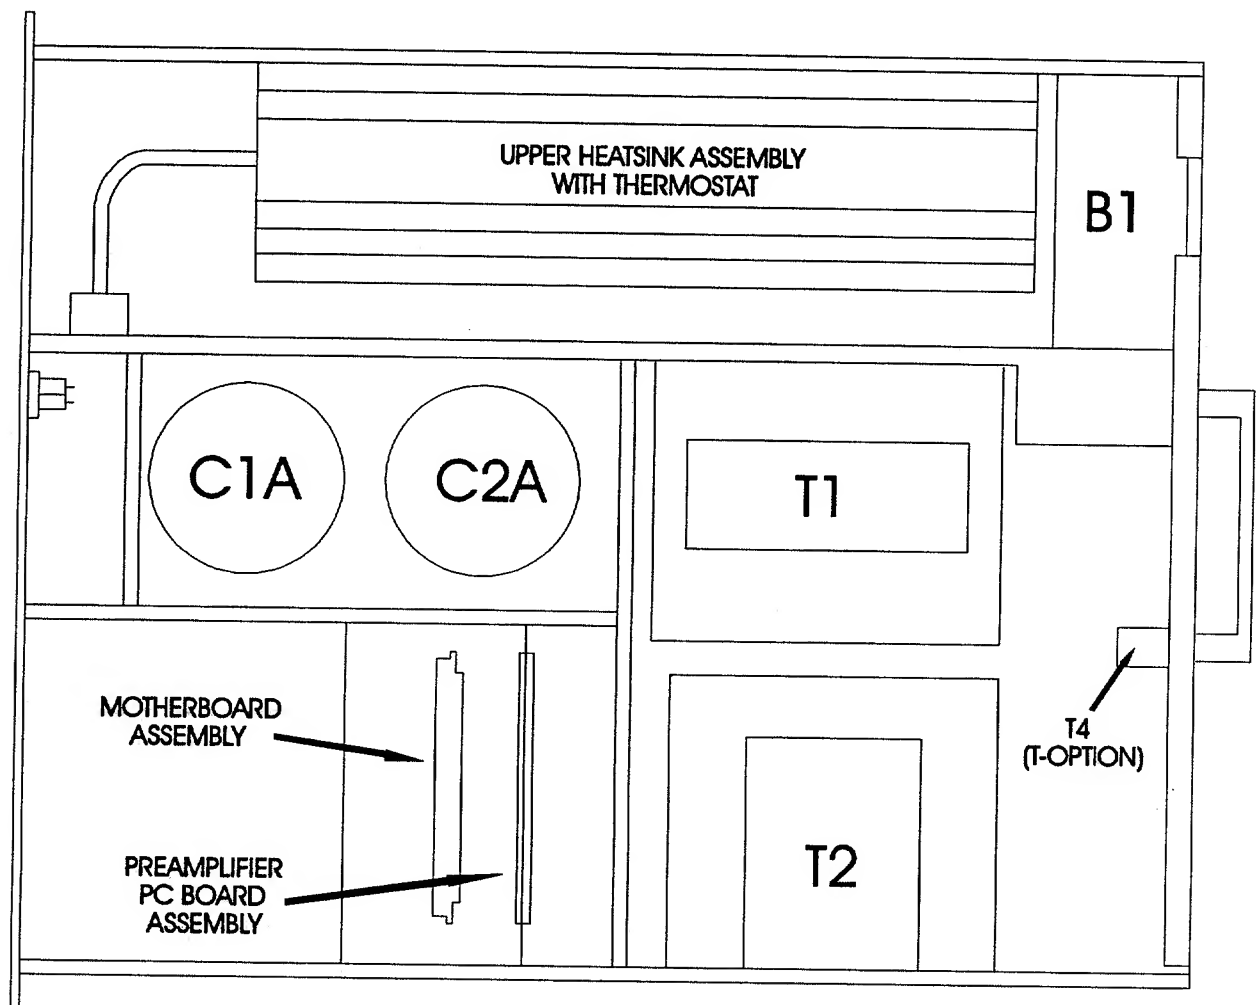

Figure 2-1. Model 1001SLE (Top View, Cover Removed)

**Figure 2-2. Model 1001SLE (Bottom View, Cover Removed)**

**Figure 2-3. Model 1751SLE (Top View, Cover Removed)**

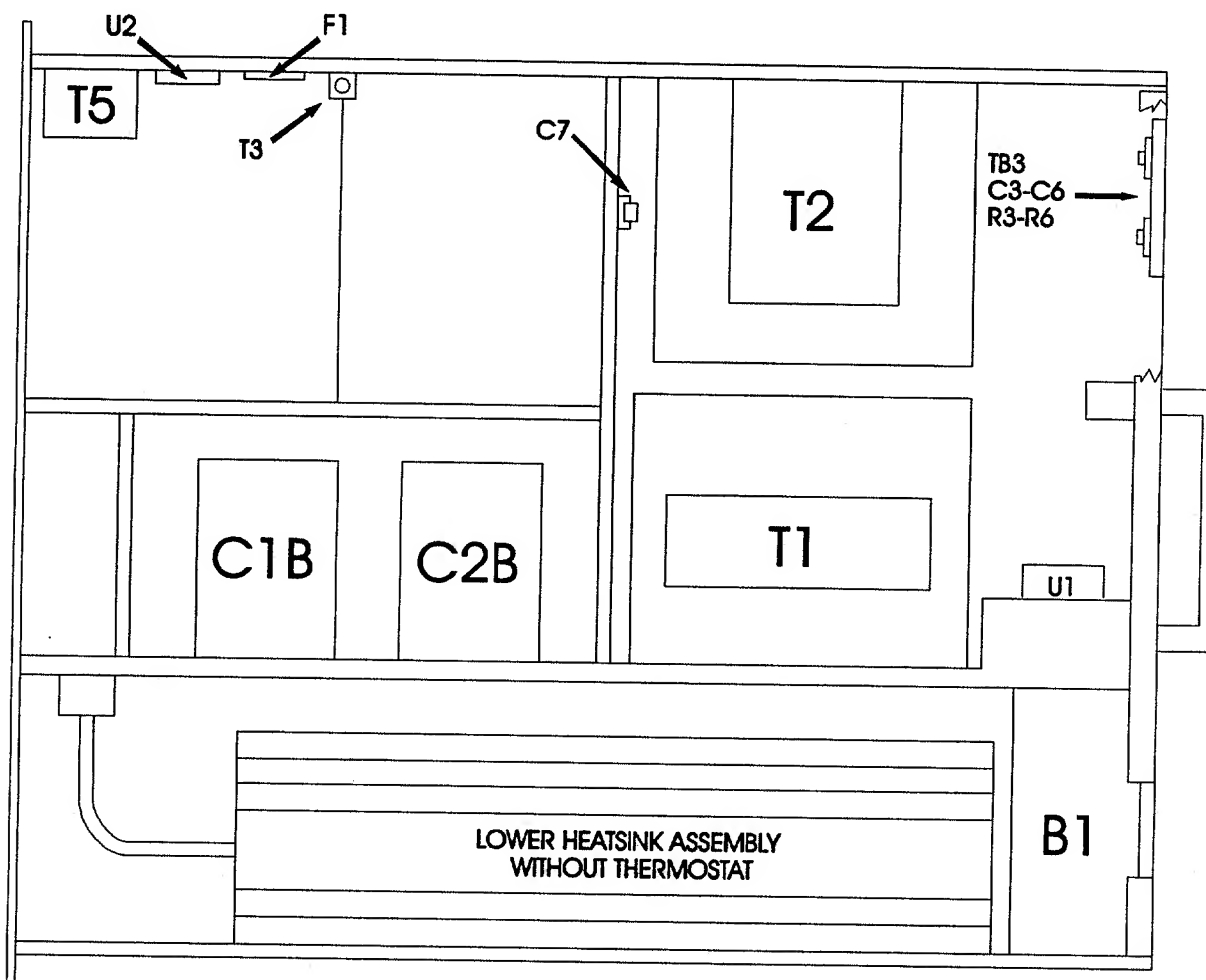

Figure 2-4. Model 1751SLE (Bottom View, Cover Removed)

## 2.5 ADJUSTMENTS

Test points and adjustment controls are conveniently provided at the top of the amplifier circuit board, accessible by removing the top cover of the power source (refer to Drawing No. 5070004). The test points are as follows:

- TP1     Circuit Common - Brown
- TP2     Amplifier Output - Red
- TP3     Oscillator Signal - Orange
- TP4     U1A Collector - Yellow

### 2.5.1 Output Regulation Adjustment

The regulation adjustment on the preamplifier, resistor R26, is set at the factory to provide  $\pm 1\%$  load regulation over the full frequency range of the power source. The regulation may require readjustment if the load is highly reactive or if zero regulation is desired for a specific load and frequency.

To make this adjustment, perform the following:

1. Disconnect the load.
2. Read the output voltage.
3. Re-connect the load.
4. Adjust R26 until the same reading as in step 2. above is obtained.

**NOTE:** If the load is sufficiently heavy to cause current limit transistors Q2 and Q3 to conduct, the output voltage will be reduced, giving an indication of poor load regulation. Load voltage fall-off due to current limiting action should not be compensated by the regulation adjustment.

### 2.5.2 Current Limit Adjustment

The current limits have been preset at the factory such that the unit will deliver full rated power over the output voltage range. Readjustment of the limits should not be performed unless a malfunction has occurred in the unit and parts have been replaced to affect the current limit. The current limit adjustment may be checked by observing the waveform at TP2 with an oscilloscope.

Perform the following:

1. Set the oscilloscope sensitivity to 10 volts/cm.
2. Turn the unit on and adjust the output for 130VAC on the 0-130VAC output voltage range as indicated on the meter.
3. Connect a load as follows:
  - a. A 11.27 Ohm load (11.53 Amps) to the output terminals of the 1001SLE (load must be capable of dissipating 1500W); or,
  - b. A 6.44 Ohm load (20.19 Amps) to the output terminals of the 1751SLE (load must be capable of dissipating 2625W).
4. Adjust the current limit potentiometers clockwise until peak clipping is observed at TP2.
5. Adjust the limit potentiometers counter-clockwise until clipping just disappears.

## **2.6 TROUBLESHOOTING/FAULT SYMPTOMS**

### **2.6.1 Circuit Breaker Trips**

If the circuit breaker trips at no load, a fault in either the power transistors or the power rectifiers is indicated. Perform the following:

1. Unplug the heatsink assemblies and try the circuit breaker.
2. If it does not trip, look for a shorted power transistor (power transistors can be checked with an ohmmeter).
3. If the circuit breaker still trips, look for a shorted rectifier bridge.
4. If the rectifier bridge and filter are good, a fault in the power transformer or wiring harness probably exists.

### **2.6.2 Output Distortion**

Overloading may cause output distortion. Check the load current waveform with an oscilloscope. An oscilloscope is recommended because some high crest factor loads may draw considerably more peak current than is indicated by a load ammeter.

### **2.6.3 Overheating**

If overheating causes thermostat TK1 to close, the output voltage will fall to zero. Overheating may be caused by restricted airflow or environmental temperature greater than 50°C (122°F).

### **2.6.4 +8V Power Supply Failure**

The T5, U2, and F1 circuit create the +8V supply that is used in the Plug-In oscillator module to create the +5VDC logic supply. This +8V supply also provides the power to the "POWER ON" indicator, DS1, located on the front panel of the AC Power Source. If the +8V power supply is not operating properly, the DS1 indicator will not come on although the cooling fan(s) are operating when the circuit breaker is turned on. An oscillator module will not output a drive signal under this condition either. Check the chassis mounted secondary fuse, F1, which should open in the event of excessive current draw in this circuit. Only replace fuse F1 with the same 2A Slo-Blo type fuse. Failure to do so, may result in additional damage to the unit.

## **2.7 REAR PANEL REMOVAL**

Should troubleshooting and repair require better access to components located in the rear of the chassis, the panel mounting screws can be removed. Great care should be used when moving the rear panel; the wiring cannot be unattached. Therefore, the rear panel can only be moved 2" to 3" from its mounted position. Trying to move or force the rear panel further may result in damage to wiring and/or components in the rear of the chassis.

## **2.8 REPAIR AND REPLACEMENT**

Generally, if parts are suspected of damage, the parts shall be checked with a multimeter for proper electrical value prior to replacement.

## **2.9 CIRCUIT BOARD ASSEMBLIES**

Circuit board assemblies can be either repaired or replaced if either a part or the circuit card is damaged. De-energize the unit before removing any circuit board assembly. To remove a circuit board, remove the retainer hardware and pull straight up on the circuit board, taking care not to damage circuit components.

When re-installing a circuit board, carefully fit the edge of the circuit board in the connector and press firmly to seat. Re-attach the retainer hardware to ensure that the circuit board(s) are firmly mounted.

**2.10 FACTORY REPAIR**

Do not replace factory selected parts. If necessary to return an instrument to the factory for repair, contact the Elgar Service Department for shipment authorization.  
**DO NOT RETURN THE UNIT FOR REPAIR WITHOUT AUTHORIZATION.**

### **3.1 GENERAL**

This section contains a listing of all part numbers used in the manufacture of the Model 1001SLE/1751SLE AC Power Source. Parts are located on the diagrams provided in Section IV and correlated on the parts list by using their reference designators and/or Elgar part number.

**NOTE:** Trimming capacitors are factory selected and their replacement is considered beyond the scope of customer maintenance.

### **3.2 SPARE PARTS ORDERING**

When ordering spare parts, specify the part name, part number, manufacturer, component value, and rating. If complete assemblies are desired, contact:

**ELGAR ELECTRONICS CORPORATION**

Sales & Technical Support

## 4.1 GENERAL

This section contains the schematic diagrams and parts layout diagrams for the Model 1001SLE/1751SLE AC Power Source. The schematic diagrams should be used to understand the theory of operation and as an aid in troubleshooting the unit.

Components identified as "trim" or "FSV" are factory selected parts whose values are determined at the time of final checkout.

## 4.2 DIAGRAMS

Table 4-1 provides a list of the diagrams included in this section.

**Table 4-1. Model 1001SLE/1751SLE Diagram List**
